1		`import pickle` `import numpy as np`

2	Load the model we have from Linear regression	`model = pickle.load(open('modelSalaryPredictor.nair','rb'))`
		`model`
		
		LinearRegression(copy_X=True, fit_intercept=True, n_jobs=None, normalize=False)

	We can save the model and load it and use it in an application.
	
	We entered as 12 as a year
	And we got Predicted Salary as: 139338.88638066
		`yearsExp = float(input("Enter Emp Years of Exp: "))`
		`preSal = model.predict(np.array([[yearsExp]]))`
		`print("Predicted Salary is {}".format(preSal))`
		
		`Enter Emp Years of Exp: 12`
		`Predicted Salary is [[139338.88638066]]`

		`yearsExp = float(input("Enter Emp Years of Exp: "))`
		`npYearsExp = np.array([[yearsExp]])`
		`preSal = model.predict(npYearsExp)`
		`print("Predicted Salary is {}".format(preSal))`
		
		`Enter Emp Years of Exp: 32`
		`Predicted Salary is [[328959.63765441]]`
